Example 1)

1-[(5,6-Dimethyl-2-methoxypyrazin-3-yl)aminocarbonyl]-4-phenylpiperazine

a) Phenyl N-(5,6-dimethyl-2-methoxypyrazin-3-yl)carbamate:

3-Amino-5,6-dimethyl-2-methoxypyrazine(1.00g, 6.53mmol) and phenylchloroformate(1.02g, 6.53mmol) were dissolved in dichloromethane and stirred at room temperature for 2 hours. The resulting mixture was concentrated under the reduced pressure to remove the solvent and purified by column chromatography to obtain the titled compound.

yield: 98 %

m.p.: 101~103℃

Antitumor activities of the compounds of the present invention were tested *in vitro* against 5 kinds of human tumor cell lines and a leukemia tumor cell line. The method and result of the *in vitro* tests is as follows.

Experimental 1 : In vitro antitumor effect against human tumor cell lines.

A. Tumor cell line : A549 (human non-small lung cell)
SKOV-3 (human ovarian)
HCT-15 (human colon)
XF 498 (human CNS)
SKMEL-2 (human melanoma)

B. SRB Assay Method.

a. Human solid tumor cell lines, A549(non-small lung cell), SKMEL-2(melanoma), HCT-15(colon), SKOV-3(ovarian), XF-498(CNS) were cultured at 37℃ in 5% CO_2 incubators using RPMI 1640 media containing 10% FBS, while they were transfer-cultured successively once or twice per week. Cell cultures were dissolved in a solution of 0.25% trypsin and 3 mM CDTA PBS(-) and then cells were separated from media which the cells were sticked on.

b. 5×10^3~2×10^4 cells were added into each well of 96-well plate and cultured in 5% CO_2 incubator, at 37℃, for 24 hours.

c. Each sample drug was dissolved in a little DMSO and diluted with the used medium to a prescribed concentration for experiments, wherein the final concentration of DMSO was controlled below 0.5%.

d. Medium of each well cultured for 24 hours as above b. was removed by aspiration. Each 200 μl of drug samples prepared in c. was added into each well and the wells were cultured for 48 hours. Tz(time zero) plates were collected at the point of time drugs were added.

e. According to the SRB assay method, cell fixing with TCA, staining with 0.4% SRB solution, washing with 1% acetic acid and elution of dye with 10mM Tris solution were carried out on Tz plates and culture-ended plates, whereby OD values were measured at 520 nm.

C. Calculation of result

a. Time zero(Tz) value was determined with measuring the SRB protein amounts of the Tz plates collected at the point of time drugs were added.

b. Control value(C) was determined with the OD values of wells untreated with a drug.

c. Drug-treated test value(T) was determined with the OD values of drug-treated wells.

d. Effects of drugs were estimated with growth stimulation, net growth inhibition, net killing etc., being calculated from Tz, C and T.

e. If $T \geq Tz$, cellular response function was calculated by $100x(T-Tz)/(C-Tz)$, and if $T < Tz$, by $100\times(T-Tz)/Tz$. The results are shown in the next table 1.

Acute toxicity test (LD_{50}) :

A. Method : Litchfield-Wilcoxon method.

6 weeks old ICR mice(male 30±2.0g) were fed freely with solid feed and water at room temperature, 23±1℃ at humidity 60±5%. Sample drugs were injected into abdominal cavities of mice, while each group comprises 6 mice. Observed during 14 days, external appearances and life or death were recorded, and then, visible pathogenies were observed from dead animals by dissection. LD_{50} value was calculated by

Litchfiled-wilcoxon method.
